Mainstream Water Solutions Confirms No Bisphenol A Used in the Company's Water Treatment Systems

(Staff Writers) Mainstream Water Solutions Inc. of Regina Saskatchewan announces that its suppliers have recently confirmed that no bisphenol A is used in the manufacture of any of the components in the Company's drinking water treatment systems.

Following the recent concerns expressed by Health Canada regarding the use of bisphenol A in the manufacture of many plastics-based products, Mainstream contacted all of its suppliers requesting confirmation that the plastic products such as tanks, piping, fittings and valves do not contain any bisphenol A.

All of the Company's suppliers have formally responded, confirming that no bisphenol A is present in any of the components of the Company's drinking water treatment systems.

As a result existing system owners and potential future customers can be

assured that no risk from this source exists in the products supplied by Mainstream.

Mainstream manufactures and distributes Ozone-Assisted Biological Filtration drinking water treatment systems to clients in the rural residential, agricultural, commercial and small to medium sized municipal markets, across Western Canada and beyond. The company's products are recognized as environmentally and user friendly.

Further information on Mainstream and its drinking water treatment systems can be obtained from the Company's web site www.mainstreamwater.com.
